                                                                                   Example 7; Page 21-22; 37pp; Japanese.

Example 7; Page 21-22; 37pp; Japanese.

The present sequence represents a probe used in an example from the present invention. The present invention describes an analytical solid phase method for detecting nucleic acids. The method comprises obtaining a base sequence which hybridises with the polynucleotide sequence of the target, and a set of probes immobilised on the solid phase via a linker which is enzymatically ligated during hybridisation. The product is used for the detection of specific nucleic acids. Possible fields of application include diagnosis of disease, detection of drug sensitivity, screening for appropriate transplantation organs, testing in the food screening for appropriate transplantation organs, testing in the food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13599

demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

INFORMATION FOR SEQ ID NO: 11:

SEQUENCE CHARACTERISTICS:

LENGTH: 60 base pairs

TYPE: nucleic acid

STRANDEDNESS: single

TOPOLOGY: linear

MOLECULE TYPE: Other nucleic acid, Synthetic DNA
US-08-241-465B-11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 2

Thus, the origin of this clone is uncertain. This caution should kept in mind should you use this clone.

Thus, the origin of this clone is uncertain. This caution should be kept in mind should you use this clone.

Competition experiments using the DNAseI protection assay showed that an oligonucleotide conty. 15 tandem ATT repeats was an effective competitor for binding of the HeLa factor. This oligo was used to prepare an oligonucleotide affinity column for purification of RIP60 from Chinese hamster cells. The protein recognises and binds to an (ATT)n motif in the dhir gene ori. It can also bind to the yeast ARSI domain B. See Q22753 and Q24811.

PI acid-glycolic acid polyester in which monomer units are acid-glycolic acid polyester in which monomer units are racid-glycolic acid polyester in which monomer units are PI individually and specifically determined

Example 1; Page 45; 67pp; English.
CC encode polyesters given in Q71801-02. This fragment was ligated into the Klenow blunted sequences given in Q71801-02. This fragment was ligated into this synthetic fragment under the control of the E. coli trpA initiator sequence was used to express the sequences control of the E. coli trpA initiator sequence was used to express the sequences of polyesters derived from the a-amino acid analogues of an amino acid except Pro. Of the three stop codons, UAA, UAG and UGA, one of these control of the polyester. Initiation of the stop signal for the polyester. The except proceed by an acid analogues of an amino acid codon, therefore the first lactate and glycolate are encoded by UAA and CC waf, respectively. Initiation of translation always starts at an AUG codon, therefore the first lactate of the chain may be encoded by an CC wet is incorporated in the first position of the polymer chain. The composition of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁

The resulting plasmid pMAL-2c contains the complete polypeptide leader. The resulting plasmid pMAL-2c contains the complete polypeter coding sequence ligated in frame with ct the leader sequence. The expressed sequences represent synthetic genes which were used in the synthesis of polysters derived from the cc armino acid analogues of an amino acid except fro. Of the three stop codons, UAA, UAG and UGA, one of these stop codons is reversed for the cc stop signal for the polyester. The remaining two stop codons are available for encoding the monomer units of the polyester. Lactate cand glycolate are encoded by UAA and UAG, respectively. Initiation of translation always starts at an AUG codon, therefore the first lactate cof through the use of a specially modified Met-tRNAH modified to carry carry the instead of Met. Alternatively, a Met is incorporated in the first position of the polymer chain. The resulting polymer is treated cuth cyanogen bromide to remove the Met. Co-polymer sproduced in this manner may be used to produce sutures, staples, clips, drug delivery constructions.

CC This sequence represents a fragment of the plasmid psporT Ic which contains the 5' fragment of the synthetic genes which encode polyesters, contains the 5' fragment of the synthetic genes which use sites A further initiator and followed by Fokl and Hinddill restriction sites A further fragment of the synthetic genes were ligated into psporT Ic to give plasmid psporT Id (see also Q71810-11), with the final fragment being conserved in a third round of ligation to give psporT ie (see also Q71812-13). The E. coli trpA initiator sequence was used to express the full length sequences represent synthetic genes which were used in the expressed sequences represent synthetic genes which were used in the corresponding to the synthesis of polyesters derived from the a-amino acid analogues of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Of the three stop codons, UAA, UAG and UGA, one of these stop codons is reversed for the stop signal for the polyester. The remaining two stop codons are available for encoding the monomer units of the polyester. Lactate and glycolate are encoded by UAA and UAG, respectively. Initiation of translation always starts at an AUG codon, therefore the first lactate of the chain may be encoded by an AUG codon. This is accomplished through the use of a specially modified MettRNAf modified to carry lactate instead of Met. Alternatively, a Met is incorporated in the first position of the polymer chain. The resulting polymer is treated with cyanogen bromide to remove the Met. Co-polymers produced in this manner may be used to produce sutures, staples, clips, drug delivery devices, pins and screws.

Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation.

Example 1; Page 45; 11/pp; English.

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

PT New Oligomers contg. modified bases - which form a triplex with PT G-C doublet in a DNA duplex, for treating and diagnosing HIV, PT hepatitis, herpes, malignancy and inflammation

PT G-C doublet in a DNA duplex, for treating and diagnosing HIV, PT hepatitis, herpes, malignancy and inflammation

PT G-C doublet in a DNA duplex of inflammation

PT G-C doublet in a DNA duplex in the forming a triplex at the patient in the following and inflammation in the following in the following in the following a triplex at the following in the form an oraylose climer synthon. The linking gp. is oraylose (nucleotides have the 3 considered by in vitro systems and residue to form the dimer contains and inverted polarity region formed from an oraylose climer synthon. This additional modifications may render the oligomer stable conclease activity. The oligomer is able to inhibit gene expression, cas verified by in vitro systems.

Example 1; Page 45; 117pp; English.

This is the nuclectide sequence for the PCR primer used in the
amplification of the Alu repeat sequence, which is used to
demonstrate the processes described in the invention. It involves
the creation and use of circular yeast artificial chromosome (YAC)
to selectively clone specific nucleic acids from a background of
mixed nucleic acids by introducing the vector(s) into E. coli cells.

They can be used to rapidly isolate human DNA where only a part of the
sequence of DNA is known. Using the methods large fragments of DNA can
be easily cloned and analysed.

WPI; 95-206931/27.
Identifying gene signatures in 3'-directed human cDNA library -
for diagnosis of abnormal cell function, by preparing cDNA that
reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            126410 standard; cDNA to mRNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               유
                      Pr Assay for testing the carcinogenic properties of a test substance by introduction of a reporter gene expression vector containing a propertitive DNA sequence that is unstable in cancer cells repetitive DNA sequence that is unstable in cancer cells properties page 15; 103pp; English.

CC The present sequence represents an oligonucleotide used in the course of the construction of assay plasmids, which are used in the course of the construction of assay plasmids, which are used in the course of the construction. The specification describes an assay for testing the construction of assay plasmids, which are expression vector comprises of invention. The specification describes an assay for testing the carcinogenic properties of a test substance. The assay comprising a crepetitive DNA sequence which exhibits instability in cancer cells, confidently instability of the repetitive DNA sequence affects expression of the reporter gene, exposing the resulting cells to the test substance can anti-carcinogenic by comparing the frequency of reporter gene expression in cells which have not been exposed to the test substance. The assay can be used to identify human dietary components that protect against DNA contents of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

The amplified fragments then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method cabe used to detect genetic variation. See Q27389-Q27404 and Q33141-Q33144. CC The present sequence represents an oligonuclectide used in the course of the construction of assay plasmids, which are used in the course of the construction of assay plasmids, which are used in the course of the construction. The specification describes an assay for testing the cc carcinogenic properties of a test substance. The assay comprises of introducing into cells a reporter gene expression vector comprising a repetitive DNA sequence which exhibits instability in cancer cells, whereby instability of the repetitive DNA sequence affects expression of the reporter gene, exposing the resulting cells to the test substance cand determining whether the test substance is carcinogenic or anti-carcinogenic by comparing the frequency of reporter gene expression in the resulting cells with the frequency of reporter gene expression in cells which have not been exposed to the test substance. The assay can be used to identify human dietary components that protect against DNA contribute to the scientific basis for a healthy diet.

The present sequence represents a repetitive oligonucleotide used in the construction of assay plasmids, which are used in the course of the invention. The specification describes an assay for testing the carcinogenic properties of a test substance. The assay comprises introducing into cells a reporter gene expression vector comprising a repetitive DNA sequence which exhibits instability in cancer cells, whereby instability of the repetitive DNA sequence affects expression of the reporter gene, exposing the resulting cells to the test substance and determining whether the test substance is carcinogenic or anti-carcinogenic by comparing the frequency of reporter gene expression in the resulting cells with the frequency of reporter gene expression for the used to identify human dietary components that protect against DNA instability, and therefore some types of cancer, and can be used to contribute to the scientific basis for a healthy diet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 0.1%; Score 28; DB Best Local Similarity 100.0%; Pred. 095177 is a simple tandem repeat (STR) corresponding to the 2nd part of wgla2. The STR can be used for treatment and diagnosis in human and veterinary medicine, partic. for genetic characterisation, mapping, linkage studies and analysis/diagnosis of acquired disease alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Q95177; standard; DNA; 57 BP.

PT Polymorphic bovine DNA markers - used in genetic identification,

PT gene mapping, and selective breeding

PT apile 7; Page 185; 517pp; English.

CC The sequence 1st that of a bovine microsatellite sequence obtd. by

CC conceoning a library of bovine MboI DNA fragments of between

CC one out of 50 clones cross-hybridised. Assuming independent

CC one out of 50 clones cross-hybridised. Assuming independent

CC offin >p microsatellites in the bovine genome is estimated at >100,

CC Offin >p microsatellites in the bovine genome is estimated at >100,

CC offin >p microsatellites in the bovine breath (see below).

CC offin sequences information for ca. 230 such bovine microsatellites

CC offin sequences upstream and downstream of the microsatellite sequence

CC were used to generate the required PCR primers for in vitro

amplification of the corresp. microsatellite (using the program of primary). The microsatellites may be used to identify individuals, complication and in the generate for in vitro

cc oppiprimy. The microsatellites may be used to identify individuals, complification, and in the generatic mapping of economic trait cross-complication, and in the generatic mapping of economic trait cross-complication of the corresponding of economic trait cross-complication of continuous elective breeding.

CC sequence 64 BP; 1 A; 2 C; 31 G; 30 T;
